Best Practices for Health IT Service Desk Performance

Our experience supporting hundreds of facilities across the country informs our best practices around high-performing service desks that are so critical to health system operations.

Go beyond contractual service levels and define what you truly need your metrics to indicate.

The metrics you focus on should be indicators of the following:

Financial Value Added to the Organization

Satisfaction of the End-User Community

Identify Needs for Improvement

Minimize Adverse Impact on Operations

Use First Contact Resolution (FCR) as a better indicator of user satisfaction and productivity.

First Contact Resolution is a better indicator of user satisfaction and understanding the percentage of incidents that have a lesser impact on downtime/unproductivity.

First Level Resolution helps give an overall understanding and indicator of financial savings based on incidents that would be handled by level 2 or 3 resources if the incident had not been resolved by a level 1 agent.

Compare the gaps between Actual and In-Scope FCR for finding areas of improvement.

Actual FCR =
Total Contacts Resolved/
Total Contacts Received.

In-scope FCR =
Resolution rate of incidents deemed resolvable through an agreement.

4

Evaluate the experience around ticket reassignments and whether misrouted incidents are delaying resolution.

Escalated tickets with the incorrect details or assignments to the wrong group should occur no more than 1% of the time.

5

Determine the balance between Average Speed to Answer (ASA) and acceptable hold times to achieve the proper cost structure.

CereCore clients reported the best value and user satisfaction at 80% of calls answered within 60 seconds (coupled with a high resolution rate).
